

SCUTTLE

Kinematics Guide

revised 2021.10.20

SCUTTLE Coordinates

This slide is for reference.

The beagle circuit board has an IMU with y-axis pointing along the USB port.

The global x- is often decided to be aligned with magnetic North.

The SCUTTLE body-fixed X vector is aligned with the forward direction.

SCUTTLE Kinematics

This guide covers:

- Robot geometry, r , and L
- Important variables: ϕ , x , y , and θ
- Kinematic equation: convert wheel speeds to chassis speeds
- The time-derivatives of the wheel and chassis displacements
- Rotation matrix to convert body-fixed coordinates to global coordinates

SCUTTLE: a Non-Holonomic System

A holonomic robot has the same number (or more) of controllable degrees of freedom as the number of degrees of freedom.

SCUTTLE DOF: (x, y, theta)

CONTROLLABLE DOF: (left motor, right motor)

Mecanum Robot DOF: (x,y,theta)

In a non-holonomic system, the final position of the robot depends on the path taken to achieve the movement.

Example:

Move right wheel, then left

Move left wheel, then Right

Suitable for
beginners

Holonomic:

Easier navigation
More parts
Less robust

Requires knowledge
of kinematics

Non-Holonomic:

Harder navigation
Fewer parts
More robust

SCUTTLE Kinematics

- The **Chassis Geometry** determines the equations for kinematics.
- The **radius**, r , is the radius of the driven wheel
- The **half-wheelbase**, L , is the space from wheel center to center divided in two

SCUTTLE Kinematics

- **Phi dot** is the derivative of phi with respect to time.

$$\dot{\phi}_L = \text{pdl}, \text{ as in phi_dot_l}$$

$$\dot{\phi}_R = \text{pdr}, \text{ as in phi_dot_r}$$

```
phiDots = np.array( [ pdl, pdr ] ) # python  
syntax
```

SCUTTLE Kinematics

- **Theta** describes the difference between the body-fixed frame and the global frame.
- The **rotation matrix** converts body-fixed coordinates to the global coordinates

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} x_{bf} \\ y_{bf} \end{bmatrix}$$

SCUTTLE Kinematics

- Phi is the angle of the wheel.
 - It is used to define incremental changes in wheel position and to calculate wheel speeds
- The x,y coordinate system has x pointing forward on the bot.
 - Positive movement of both phi's result in positive movement of the robot along the x-direction
- The Kinematic Equation generates chassis motion information.
 - input the wheel speeds and output the (translational and rotational) chassis speeds

$$\begin{bmatrix} \dot{x} \\ \dot{\theta} \end{bmatrix} = \begin{bmatrix} R/2 & R/2 \\ -R/2L & R/2L \end{bmatrix} \begin{bmatrix} \dot{\phi}_L \\ \dot{\phi}_R \end{bmatrix}$$

SCUTTLE Kinematics

- Inverse Kinematic equation:
 - Input the desired speed and angular speed, and output the left and right wheel speeds.
 - These equations are written in the robot-fixed frame

$$\begin{bmatrix} \dot{\phi}_L \\ \dot{\phi}_R \end{bmatrix} = \begin{bmatrix} 1/R & -L/R \\ 1/R & L/R \end{bmatrix} \begin{bmatrix} \dot{x} \\ \dot{\theta} \end{bmatrix}$$

matrix multiplication: $[C] = [A][B]$

SCUTTLE Kinematics

- Comparing forward and inverse kinematics:

“Kinematics”

Use the **wheel** speeds to
obtain the **chassis** speeds

$$\begin{bmatrix} \dot{x} \\ \dot{\theta} \end{bmatrix} = \begin{bmatrix} R/2 & R/2 \\ -R/2L & R/2L \end{bmatrix} \begin{bmatrix} \dot{\phi}_L \\ \dot{\phi}_R \end{bmatrix}$$

“Inverse Kinematics”

Use the **chassis** speeds to
obtain the **wheel** speeds

$$\begin{bmatrix} \dot{\phi}_L \\ \dot{\phi}_R \end{bmatrix} = \begin{bmatrix} 1/R & -L/R \\ 1/R & L/R \end{bmatrix} \begin{bmatrix} \dot{x} \\ \dot{\theta} \end{bmatrix}$$

SCUTTLE Kinematics (prt 2)

This section will be expanded to discuss navigation

Describing the robot in the inertial (global) frame:

- P_0 describes the location of the robot and is defined by the center of the wheelbase.

$$q^I = \begin{bmatrix} x_a \\ y_a \\ \theta \end{bmatrix}$$
